carbohydrate chemistry provides review coverage of all publications relevant to the chemistry of monosaccharides and oligosaccharides in a given year the amount of research in this field appearing in the organic chemical literature is increasing because of the enhanced importance of the subject especially in areas of medicinal chemistry and biology in no part of the field is this more apparent than in the synthesis of oligosaccharides required by scientists working in glycobiology glycomedicinal chemistry and its reliance on carbohydrate synthesis is now very well established for example by the preparation of specific carbohydrate based antigens especially cancer specific oligosaccharides and glycoconjugates coverage of topics such as nucleosides amino sugars alditols and cyclitols also covers much research of relevance to biological and medicinal chemistry each volume of the series brings together references to all published work in given areas of the subject and serves as a comprehensive database for the active research chemist specialist periodical reports provide systematic and detailed review coverage in major areas of chemical research compiled by teams of leading authorities in the relevant subject areas the series creates a unique service for the active research chemist with regular in depth accounts of progress in particular fields of chemistry subject coverage within different volumes of a given title is similar and publication is on an annual or biennial basis

this is the first book that provides a detailed summary of one of the most successful new condensed matter theories dynamical mean field theory dmft in both static and dynamical cases of systems of different sizes dmft is one of the most successful approaches to describe the physical properties of systems with strong electron electron correlations such as bulk materials multi layers surfaces 2d materials and nanostructures in both metallic and insulating phases strongly correlated materials usually include partially filled localized d or f orbitals and dmft takes into account crucial for these systems time resolved interaction between electrons when they meet on one atom and occupy one of these orbitals the first part of the book covers the general formalism of dmft as a many body theory followed by generalizations of the approach on the cases of finite systems and out of equilibrium regime in the last chapter of the first part we discuss generalizations of the approach on the case when the non local interactions are taken into account the second part of the book covers methodologies of merging dmft with ab initio static density

functional theory dft and time dependent dft tddft approaches such combined dft dmft and dmft tddft computational techniques allow one to include the effects of strong electron electron correlations at the accurate ab initio level these tools can be applied to complex multi atom multi orbital systems currently not accessible to dmft the book helps broad audiences of students and researchers from the theoretical and computational communities of condensed matter physics material science and chemistry to become familiar with this state of art approach and to use it for reaching a deeper understanding of the properties of strongly correlated systems and for synthesis of new technologically important materials
